FIG. 3

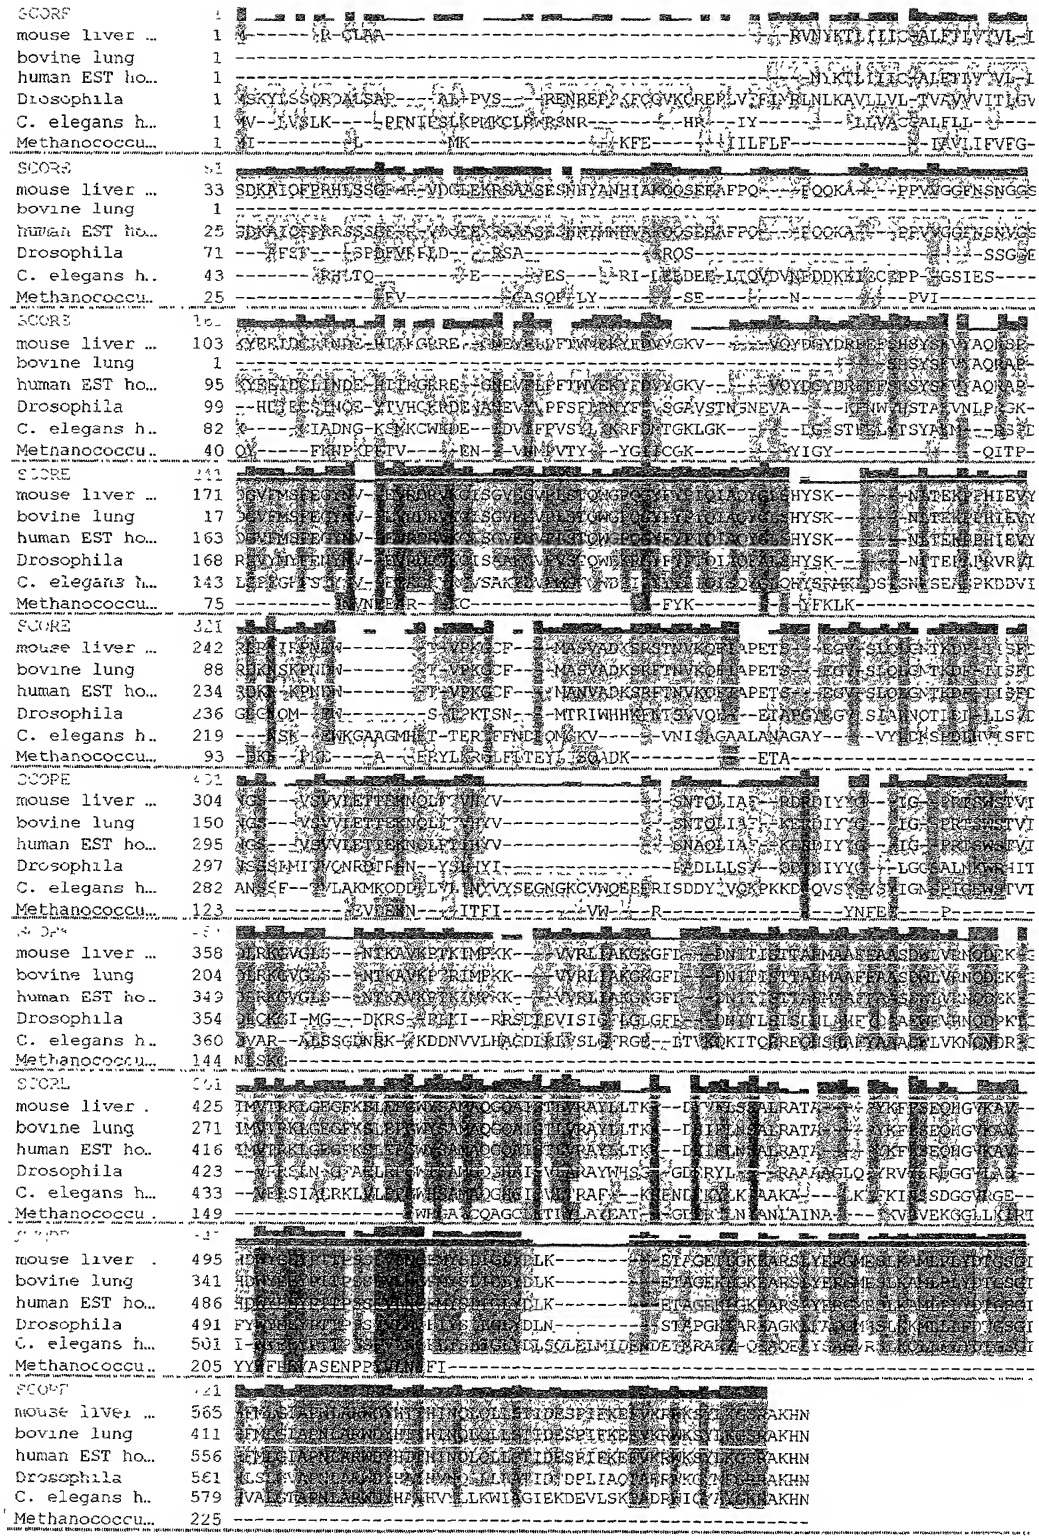

Fig. 4

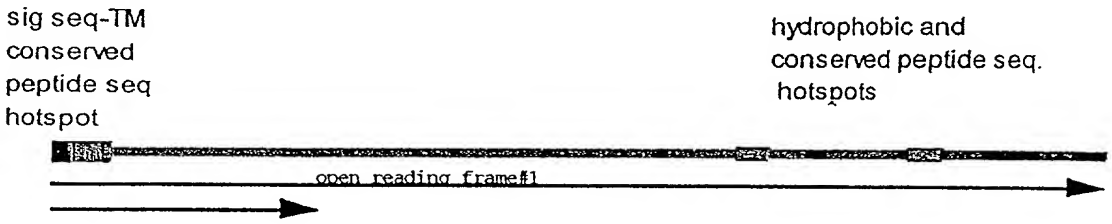

Hypothetical orientation, **if** inserted into golgi

cytosol->lumen----------->cytosol------>lumen

Key:

signal sequence, highly hydrophobic transmembrane (TM) sequence

Hydrophobic transmembrane (TM) or buried sequence

most conserved peptide sequence (>50% similarity to C elegans 71.9 KD hypothetical protein; 38% similarity to Methanococcus hypothetical protein). Note: peptide identity between mouse, bovine and human > 95%!

Which in text appears:

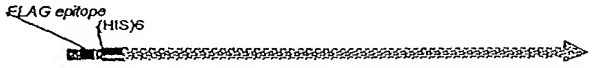
FIG. 5

FIG. 6A

First active tagged recombinant (bovine) C5
(specific activity 5 X 10^5 cpm/mg/h)



The most active recombinant (full mouse) C5
(specific activity 2 X 10^9 cpm/mg/h)

Chimeric construct
(preliminary data indicate activity is 87% of full mouse):

Truncated mouse
(preliminary data indicate activity is same as first bovine construct):
